

## Reusa- Can Method and Savings on Energy and Pollution A completely "GREEN" system

When Reusa-Can is in full production, it will be returning cans back to the packers and ultimately the supermarket shelves faster than making new cans from recycled material or new materials, which will reduce the number of cans required in circulation this should reduce steel production even more. You will see from the diagrams that the route is much shorter using the Reusa-Can concept. We could have them back on the supermarket shelves before cans sent for recycling had left the country.

This process could be accomplished ten times with the present cans and could be extended with improvements to the design of cans.
